

Using Data to Inform Standard-Setting Recommendations

Maryland Integrated Science
Assessment, Grades 5 & 8

Jennifer Judkins, MSDE | Matt Gaertner, WestEd

PART 1

Background

Background

2013

The Maryland State Board of Education adopts the Next Generation Science Standards

2016-2017

The Maryland Integrated Science Assessment (MISA) replaces the Maryland School Assessment in science

Background

Spring 2018

The MISA is administered for the first time operationally

Summer 2018

WestEd and MSDE conduct standard-setting meetings for grade 5 and grade 8 assessments

Background

Four MISA Performance Levels

Level 2	Level 3	Level 4	Level 5
Partially Met Expectations	Approaching Expectations	Met Expectations	Exceeded Expectations

Background

Three MISA Cut Scores

Level 2	Level 3	Level 4	Level 5
Partially Met Expectations	Approaching Expectations	Met Expectations	Exceeded Expectations

PART 2

Meeting Preparation

Meeting Preparation

Key Considerations for Using Data During Standard Setting

- **What** data should be shared with panelists?
- **When** should those data be shared?
- **How** should those data be shared?

Meeting Preparation

What data?

*Sharing data
with panelists:
What, when,
and how?*

- ▶ When convergence is the goal, panelists need to understand how their judgments compare to their colleagues' judgments
- ▶ Panelists have a right to know the impact of their recommendations
- ▶ Panelists are science educators, but NGSS assessments are new, so student performance is difficult to forecast

Meeting Preparation

When?

*Sharing data
with panelists:
What, when,
and how?*

- ▶ Standard setting for criterion-referenced tests should begin with content – students' knowledge and skills relative to the standards
- ▶ Panelists judgments converge incrementally through deliberation – informed but not dictated by data
- ▶ Impact data (e.g., projected proficiency rates) should be a reality check, not a starting point

Meeting Preparation

How? (... and how much?)

*Sharing data
with panelists:
What, when,
and how?*

- ▶ Without explanation and context, summary statistics (e.g., p-values) are ambiguous at best
- ▶ Standard-setting data (just like items on a test) should produce the intended interpretations
- ▶ With new standards, new assessments, and three cut scores, panelists have a lot to consider. Data overload is a real concern.

Meeting Preparation

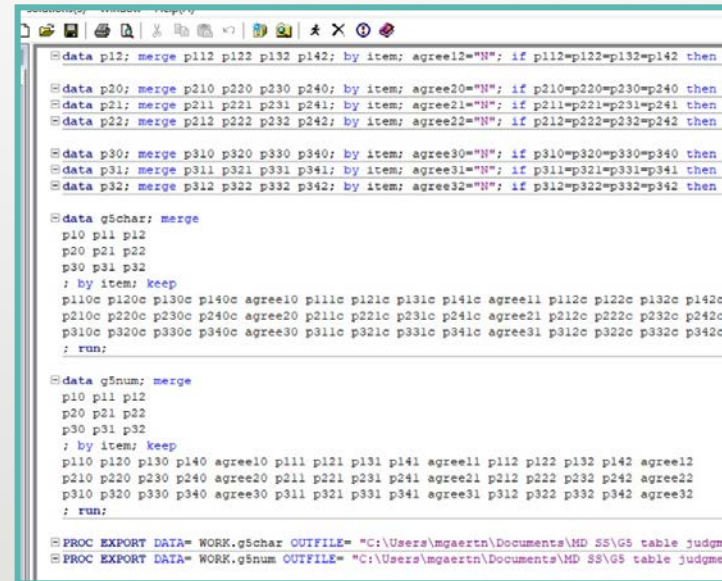

1. Student Data

PART 3

Standard Setting Meeting

Standard Setting Meeting

Three Rounds of Judgment

Round 1 Data

Judgments from your table and your grade

Round 2 Data

Judgments + item p-values

Round 3 Data

Judgments + p-values + impact data (overall and by demographic groups)

Standard Setting Meeting

Vertical Articulation

After all the judgments were complete, grade 5 and grade 8 panelists reconvened and reviewed the cut scores together, with two fundamental questions in mind...

Standard Setting Meeting

Vertical Articulation

1. From the perspectives of students, parents, educators, and the general public, do these cut scores make sense?
2. If not, how should the cut scores be adjusted?

Standard Setting Meeting

Vertical Articulation

The full group considered three relevant benchmarks in addition to MISA impact data:

- ▶ Impact data from similar states with similar NGSS-aligned assessments
- ▶ NAEP Science impact data
- ▶ PARCC Mathematics and English / Language Arts impact data

Thank you!
